TITLE: Method of disinfecting milk on farms contaminated with foot-and-mouth disease, tuberculosis, brucellosis, and paratyphoid fever

SOURCE: Veterinariya, no. 1, 1966, 92-94

TOPIC TAGS: foot and mouth disease, tuberculosis, brucellosis, bacteria, virus, food sanitation

ABSTRACT: In view of the shortage of reliable pasteurizers on farms, a mobile unit is suggested for farms contaminated with various cattle diseases. A 300-liter VDP-300 vat for prolonged milk pasteurization is mounted on a GAZ-704 trailer. Tests with various bacteria and viruses showed the method effective if a temperature of 80° C is maintained for 30 minutes. The method can be used in farm conditions, even in pastures. Detailed instructions are given for using the method under various local conditions. Orig. art. has: 2 figures. [JPRS]

"The Relative Biological Action of High-Energy Rays in Comparison  
with 200 kv X-Rays"

Sofia, Rentzenologiya i Radiologiya, Vol 5, No 3, 1966, pp 172-  
179

Abstract: Pigs 4 mos old were irradiated with 200 kv X-rays,  
γ - rays from a 1000 c<sup>60</sup> Co source, and 17.3 mev electrons. The  
doses used for each type of radiation were identical, i.e., 1300,  
1800, and 2200 rad. The biological effectiveness of the radiation  
was determined on the basis of the cutaneous reaction according  
to F. Wachsmann, Strahlenth. 76, 260, 1947. The results indicated  
that the action of high-energy radiation was weaker than that of  
the X-rays. With increasing doses of radiation, the difference  
in biological action due to the relative energy of the radiation  
increased. (Graphs, 28 references (1 Bulgarian, 1 USSR, 26  
Western). Manuscript received Mar 65.

neurolog. Klin., Plzeň. Vyznam discopathii pro vznik oparu pasoveho Importance of affections of the discs in the pathogenesis of herpes zoster Ces. Lek. tes. 1951, 90/10 (299-302) X-rays changes in the spine were studied in patients with herpes zoster. In a series of 15 cases definite radiological changes were found in 12, consisting of a degeneration of intervertebral discs at the level and on the side of the herpes zoster. In 2 cases the degeneration was only suspected. One case was without any radiological changes, nevertheless the discopathia was found at autopsy. The fixation of the virus may be explained by the diminution of the local tissue resistance. These changes are probably mediated by the autonomic system, the ganglia of which are altered by the products of degeneration arising in the altered tissue. Henner - Prague

"The Possibilities of Modifying the Function and Genesis of Insulin in Animals with Normal and Atrophied Exocrine Pancreas."

Zagreb, Lijecnicki Vjesnik, Vol 85, No 8, 1963, pp 889-891.

Abstract: The author discusses the stimulative effect of cortisole on the Langerhans islands in normal guinea pigs and the possibility of hyperplasia in guinea pigs with atrophied exocrine pancreas for purposes of determining from which elements of the exocrine pancreas new insular tissue may develop. A historical introduction reviews present-day knowledge of the function of the insular apparatus and the relations between the glucocorticoids and the insular system. The author's experiments showed that cortisole can powerfully stimulate the insular system of the pancreas with only slight hyperglycemia in guinea pigs with normal exocrine pancreas, but that cortisole in guinea pigs with atrophied exocrine pancreas causes only a mild hyperglucemic reaction without any change in glucose tolerance.

Title : Some Observations in Connection with the Preparation of  
Tetrahydropyran from Furfurol.

Orig Pub : Kemija u industriji, 1955, 4, No 6, 101-102

Abstract : Tetrahydropyran (I) was obtained from furfural, over furfuryl alcohol (II), tetrahydrofurfuryl alcohol (III) and dihydropyran (IV). Hydrogenation of furfural in the liquid phase took place in two stages: first at 150-175° and 100 atmospheres, II was obtained, then at 150° and 100 atmospheres, over a Ni-catalyst, III was formed. Conversion of III to IV took place in the liquid phase at 350°, with white bauxite from Rovin'ye serving as the catalyst. The IV thus obtained had a BP 86°, d<sub>20</sub> 0.920,

$n_D^{20}$  1.4410. Degree of conversion of III reached 70% and with complete purification of III from II, by repeated hydrogenation, the catalyst retained its activity for 60 days. Hydrogenation of IV of I took place in the liquid phase, at 50-70° and 50 atmospheres, over a Ni-catalyst, the yield of I was about 100%, BP 87-88°,  $d_4^{20}$  0.882,  $n_D^{20}$  1.420.

<sup>27</sup>  
Effect of promoters on copper catalysts in hydrogenation. <sup>7</sup>

Ivan Brihta, Dalimil Vranjican, Marikan Merzel, and Drago Vlais (Inst. Ind. Istrazivanja, Zagreb, Yugoslavia). <sup>7</sup>  
Kem. i ind. (Zagreb) 8, 112-14 (1957). —Cr<sub>2</sub>O<sub>3</sub>, MnO, FeO, MgO, and kieselguhr were found to be equally effective promoters for a CuO catalyst in the hydrogenation of acetone at 130 atm. and 160°, contrary to ZnO which was much less effective. Raney Cu proved to be far less active than CuO promoted appropriately. CuO was a better catalyst when pptd. with Na<sub>2</sub>CO<sub>3</sub> than with NH<sub>4</sub>OH. N. Flavšić

Title : Hydrogenation of Aromatics Present in Petroleum Products. Hydrogenation of High Boiling Petroleum Fractions for the Performance of Structural-Group Analyses

Orig Pub : Nafta, (Jugosl.), 1958, 9, No 2, 33-38

Abstract : In analyzing mineral oils derived from Yugoslavian crudes, the samples were hydrogenated (H) in an autoclave. The feasibility of employing molybdenum oxide catalyst supported on activated charcoal for the initial H and of Ni catalyst for hydrogenation of the higher boiling fractions has been demonstrated. The latter catalyst

is also applicable to low boiling fractions when their  
S content is low. Duration of H is approx. 3 hours.  
At the end of this time catalysts loses its activity.  
Temperature of H must be  $\leq 230^{\circ}$ . The structural analysis  
was conducted by a method based on molecular weight  
measurements and on the elementary composition of a  
sample before and after H. This method permits a direct  
determination of the percent aromatics, and average  
number of aromatic rings in a molecule. -- Ya. Satunovskiy

Copper-hydrogenation catalysts. I. Brihta, D. Vranjican, and D. Pezic (Inst. Ind. Research, Zagreb, Yugoslavia). *Arhiv Kem* 25, 121-4 (1953) (English summary).--Cu chromite catalysts become inactivated in catalytic hydrogenations, and this was assumed to be due to a reduction of  $\text{CuO}$  to  $\text{Cu}_2\text{O}$  and (or)  $\text{Cu}$ . Expts. were made (I) with a bio-activated Cu chromite catalyst according to Adkins, (II) with a catalyst  $\text{Cu}_2\text{O}:\text{CaO}:\text{Cr}_2\text{O}_3 = 10:10:5$ , and (III) with a Raney Cu catalyst. All 3 catalysts were used to hydrogenate Et oleate to octadecanol (IV), and the same results were obtained by using either 17% I, 18% II, or 8% III, the obtained IV having in each case a sapon. value of 0, an iodine value of 0, an acetyl value of 175-185, a m.p. (after recrystn. from acetone) of 55-56° if the expts. were started at 100-135 atm and the temp. raised to 200-230° for 2.5-3.5 hrs, during which time the pressure rose to 200 atm. This shows that the older ideas about catalyst inactivation are untenable, and this is corroborated by thermodynamic considerations: (1)  $\text{CuO} + \text{H}_2 = \text{Cu} + \text{H}_2\text{O}$ ,  $\Delta G^\circ = -10.80$  +  $10.77 \text{ kcal}$ ; (2)  $2\text{CuO} + \text{H}_2 = \text{Cu}_2\text{O} + \text{H}_2\text{O}$ ,  $\Delta G^\circ = -34.300$  +  $11.27 \text{ kcal}$ ; (3)  $\text{Cu}_2\text{O} + \text{H}_2 = 2\text{Cu} + \text{H}_2\text{O}$ ,  $\Delta G^\circ = -27.900$  +  $22.44 \text{ kcal}$ . Reaction (2) thus is most favored, and reaction (3) is the least favored one. Therefore the inactivation of the Cu chromite catalyst is due to the formation of  $\text{Cu}_2\text{O}$  in coarse crystals, which then are difficult to reduce or to disperse. Werner Jacobson

SOURCE: Vojenske zdravotnicke listy, no. 2, 1966, 62-65

TOPIC TAGS: radiation sickness, food preservation, food storage, tissue biochemistry

ABSTRACT: Prompt killing of animals with radiation sickness may be necessary to avoid economic loss. The quality of meat, its preservation, and its suitability for processing were investigated. Pigs were subjected to 700 r radiation, and changes in pH, ammonia, and water content were observed at room temperature (about 20C) and under refrigeration. The aging process was faster in the meat of irradiated animals and spoilage occurred sooner than in the meat of control animals. The spoiling process started about 2 days sooner in the meat of irradiated pigs when stored at room temperature, and even less than 2 days earlier in the refrigerated meat. The length of preservation was indirectly proportional to the degree of acute radiation illness suffered by the animals whose meat was tested. Orig. art. has: 2 figures and 2 tables. [KS]

APPROVED FOR RELEASE: 09/01/2001 CIA-RDP86-00513R001961210013-7  
radiated with Lethal Doses of Gamma-Radiation.

Prague, Vojenske Zdravotnicke Listy, Vol 35, No 3, Jun 66, pp 112 - 117

Abstract: Influence of a dose of 700 r of gamma radiation on the metabolism of glycosides in the blood and in the muscle tissue of pigs was investigated. In pigs that received a lethal whole-body dose of irradiation, glycoside metabolism is disturbed; this results in the upset of the balance between glucose and lactic acid in the blood, and glycogen in the liver. The limitation of oxidative synthesis of lactic acid in the blood is caused probably by the lowered activity of liver phosphorylase. 4 Figures, 5 Tables, 19 Western, 2 Czech, 9 Russian references.

"Clinical Course of Acute Radiation Sickness in Pigs."

Prague, Vojenske Zdravotnicke Listy, Vol 35, No 6, Dec 66, pp 263-267

Abstract: The pigs were subjected to whole-body radiation with 450, 700, and 1000 r by gamma rays of Co<sup>60</sup>. Radiation sickness with serious clinical aspects developed after radiation with 700 r. The maximum development of the clinical aspects of the disease appeared in the 2nd and 3rd week after radiation. This was also the period during which most of the animals died. The clinical aspect of the sickness was characterized mainly by a hemorrhagic diathesis, changes in body temperature, and loss of weight. 5 Figures, 2 Tables, 18 Western, 4 Russian, 1 Polish, 1 East German reference.
